Refer Market

Summary and feature:

This app uses a tableview to show all the refer information. And people can directly go to the corresponding websites using these information and the code or the links are ready for them. People can also save their preferred refers after they've logged into their Facebook account.

The problem it solves for the users:

It saves the user time to look for referral links. In the next version people can also post their own referral links on the app, and pay other people to use their referral links. So that both the referrer and the people getting referred will be able to split the bonus they are awarded.

Technical Details:

This app currently store its refer information in a sqlite database in the document folder locally, and save the user's saved refer in another sqlite database. The app detect whether a user is logged in the app and choose to show the saved refer info or not.
